The MK13-121Ex0-R type switching amplifiers are single channel devices featuring an intrinsically safe input circuit. They can be connected to sensors according to EN 50227 (NAMUR), variable resistors or potential-free contacts.

Three front panel programming switches enable selection of the output function (normally open or normally closed mode) and separate activation and de-activation of wire-break (switch position DB) and short-circuit monitoring (switch position K). Switch positions A and R represent normally open mode (NO) and normally closed (NC) mode, respectively.

When using mechanical contacts as the input device, wire-break and short-circuit monitoring must be disabled or shunt resistors must be connected to the contacts (II). (See next page for contact configuration).

The green LED indicates that the device is powered. The dual colour LED indicates the switching status (yellow) as well as fault conditions (red). When the input circuit monitoring feature is activated, red illuminates to indicate a fault condition in the input circuit and the output and alarm relay are de-energised.
